Additional information for the paper "A Discriminative Hierarchical PLDA-based Model for Spoken Language Recognition" by Ferrer et al. The table shows the number of samples in each train/development/evaluation dataset used in the paper for each language. For dev and eval datasets, we include separately the counts for the 8 - and 32-second chunks. For the training datasets, the count corresponds to only the original raw signals, before augmentation and chunking. In red are the lines for languages for which no training data is available (ie, out of set languages).
